

THE IMPACT OF CLIMATE CHANGE WITH FAST FASHION

WATER EXPLOITATION

The fashion industry is the second most polluting industry in the world after the Petroleum industry. Cotton, one of the two most common fibers used in our garments today (the other being polyester), absorbs 10 percent of all agricultural chemicals and 25 percent of insecticides, while it accounts for just 2.4 percent of the world's cropland.

POLLUTION AND WASTE

Fashion production makes up 10% of humanity's carbon emissions, dries up water sources, and pollutes rivers and streams. What's more, last year, 85% of all textiles went to the landfill. And washing certain kinds of clothes brings into the ocean thousands of pieces of plastic

GLOBAL WARMING

fashion industry is responsible for 10 % of annual global carbon emissions, more than all international flights and maritime shipping combined. At this pace, greenhouse gas emissions from the fashion industry will grow by more than 50 percent by 2030

ENVIRONMENTAL DAMAGE

In 2014, individuals purchased 60 percent more apparel than they did in 2000. Fashion production accounts for 10 percent of the carbon emissions of mankind, dries up supplies of water, and pollutes rivers and streams. What's more, last year, 85% of all textiles went to the landfill.

DAY OF THE EXAM

Relax and take the exam.

Infographics are visual representations of data, making complex info easier to share and digest. When making your own, simply organize your images, charts, and text. Finally, cite your sources.
